

CLIMATE CRISIS

Physics and chemistry project

We are going to begin by finding out about global warming and how this is causing climate change to planet Earth.

Activity:

You will need to watch the videos and look through the information provided by classwork and any other source, to find out all about climate change.

Whilst you are watching any video, you could pause it and make some notes on what global warming is and why it is harmful for the planet.

When you read through the other information, think about the key reasons why climate change is happening and what effect this is having on the Earth.

For sure some of you will also want to do some further research of your own so feel free! The more you find out, the better.

Task

Challenge 1: Create a poster, presentation or video explaining what climate change is.

Challenge 2: Create a poster, presentation or video explaining what climate change is and what the cause of global warming is.

Challenge 3: Create a poster, presentation or video explaining what climate change is, what the cause of global warming is and how it is affecting some of the animals that live on planet Earth.

Make sure you make your work attractive and colorful and full of information!
